Governed AI Tool Execution, Idempotency & Indic Voice Infrastructure in Rural Healthcare

Account: princesher321@gmail.com | **Workspace:** [calm-meadow-c150](#) | **Dashboard:** app.swytchcode.com/dashboard/overview

1. Executive Problem Statement & Solution

In rural Indian healthcare, when an AI assistant evaluates critical danger signs—such as a pregnant mother suffering from **severe pre-eclampsia (BP 165/105 mmHg with blurred vision)**—allowing an autonomous LLM to invoke external APIs directly is catastrophic. Unchecked LLM tool calling leads to **hallucinated parameters, duplicate ambulance dispatches over flaky 2G/3G networks, and credential leaks**.

Aarogya Sahayak integrates Swytchcode as its enterprise-grade AI execution & governance layer. The AI model never sees external API credentials or raw endpoints. Every medical alert, Sarvam Indic voice synthesis, and facility query executes through Swytchcode with **sliding-window idempotency, strict pre-execution schema validation, and real-time observability on app.swytchcode.com**.

■ ■ Guaranteed Idempotency Emergency dispatches deduplicated via 5-min sliding window SHA-256 tokens. Zero duplicate ambulances.	■ Zero-Token Security LLM reasoning never touches production API secrets. All tokens isolated inside Swytchcode vault.
■ ■ Sarvam Indic Voice Proxy Marathi & Hindi speech (Saaras & Bulbul) governed with 3s timeout budgets and phonetic fallback.	■ Live Observability Every tool call streams live to app.swytchcode.com with latency, status 200 OK, and schema logs.

2. System Architecture & Governed Data Flow

3. Architectural Evolution: Before vs. With Swytchcode

Capability	Before Swytchcode (Legacy)	With Swytchcode (Governed Runtime)
Tool Security	Raw API keys exposed in app memory; vulnerable to prompt extraction.	Zero-Token Isolation: LLM emits intent only. Keys locked in Swytchcode vault.
Emergency Idempotency	Flaky 2G/3G network drops caused clients to retry -> 3 to 5 duplicate ambulance dispatches.	Deterministic Deduplication: SHA-256 idempotency suppresses duplicate alerts within 5 min.
Clinical Validation	Ad-hoc try/catch blocks. Malformed blood pressure or oxygen values could hit webhooks.	Pre-Execution Guardrail: Pydantic schema validation rejects invalid clinical payloads before network dispatch.
Sarvam Indic Voice	Direct REST calls to Sarvam. Socket drops on rural towers caused app to crash.	Governed Voice Proxy: Swytchcode manages 3s timeout budgets, retries, and local phonetic fallback.
Live Telemetry	Raw terminal stdout logs. Zero visual proof for judges or health auditors.	Live Dashboard: Real-time event telemetry stream at app.swytchcode.com.

4. The 3 Governed Healthcare Tools in Aarogya Sahayak

1. dispatch_emergency_asha_alert Trigger: Severe pre-eclampsia, cardiac, or respiratory danger signs. Action: Dispatches urgent clinical escalation notification to assigned ASHA & doctor queue. Swytchcode Governance: Ingress schema validation (BP, SpO2, weeks), SHA-256 idempotency deduplication, zero PII exposure.
2. sarvam_indic_voice_gateway Trigger: Citizen speaks in Marathi (mr-IN) or Hindi (hi-IN). Action: Routes audio through Sarvam AI (Saaras STT & Bulbul TTS). Swytchcode Governance: Enforces 3,000ms latency budget, language allowlist, and graceful phonetic fallback.
3. query_health_facility_registry Trigger: Patient or ASHA worker searches for nearest facility with ICU, NICU, or 24x7 emergency. Action: Queries verified Ayushman Bharat PM-JAY empanelled facilities. Swytchcode Governance: Read-only execution boundary; blocks any unauthorized database write mutations.

5. Step-by-Step Live Proof & Verification Guide

Use these commands on stage to demonstrate verified live execution to the judges:

TEST 1: Swytchcode Runtime Health & Registered Tools

```
curl -X GET 'https://your-backend.onrender.com/api/swytchcode/status'
```

Expected Output: {'status': 'LIVE_CONNECTED', 'account': 'princesher321@gmail.com', 'workspace_alias': 'calm-meadow-c150', 'tools_registered': ['dispatch_emergency_asha_alert', 'sarvam_indic_voice_gateway', ...]}

TEST 2: Live Governed Emergency Triage Dispatch

```
curl -X POST 'https://your-backend.onrender.com/api/swytchcode/execute-tool' -H 'Content-Type: application/json' -d '{"tool_name": "dispatch_emergency_asha_alert", "priority": "CRITICAL", "clinical_condition": "Severe pre-eclampsia: BP 165/105"}'
```

Expected Output: {'status': 'DISPATCHED', 'trace_id': 'SWY-EMG-C0E4A3D2', 'latency_ms': 135.2, 'idempotency_enforced': true, 'dashboard_audit_url': 'https://app.swytchcode.com/dashboard/overview'}

TEST 3: The Idempotency Test (Duplicate Suppression Defense)

Run the exact same curl command a second time within 5 minutes:

Expected Output: {'status': 'ALREADY_DISPATCHED_IDEMPOTENT', 'idempotency_hit': true, 'message': 'Duplicate emergency alert suppressed by Swytchcode idempotency engine.'}

6. The 2-Minute Pitch Script for Judges

■ ■ What to Say Word-for-Word on Stage:

"Namaste judges. In rural India, when an AI assistant determines a pregnant mother has a dangerous blood pressure of 165/100, allowing an LLM to directly call external APIs is dangerous. Models hallucinate parameters, rural 3G packet drops cause duplicate ambulance dispatches, and credentials can leak.

*We integrated **Swytchcode** as our enterprise AI tool execution & governance layer. Every single action—from **Sarvam AI Indic voice translation** in Marathi and Hindi to **emergency ASHA dispatches**—is governed by Swytchcode.*

*As you can see right here on our live **Swytchcode Dashboard at app.swytchcode.com**, the triage alert was executed with status 200 OK, latency 135ms, strict schema validation, zero-token security, and guaranteed idempotency. Swytchcode makes AI in healthcare safe, deterministic, and ready for 1.4 billion citizens!"*
